

Vladimir Aleksić

FULL-STACK ENGINEER · FRONTEND-FOCUSED

Novi Sad, Serbia (UTC+2) · valeksic1337@gmail.com · github.com/vladavoX · linkedin.com/in/va99

Full-stack engineer, frontend-heavy, on a team small enough that most of the frontend is mine. I took **a product dashboard from an empty repo to production users**, own the dashboard behind a platform rendering a few hundred thousand videos a month, and build in the open — an After Effects plugin I maintain solo and an MCP server agents call. I like **tests and CI that actually catch things**, and work with Claude Code daily: writing its rules, reviewing what it produces, and adding the checks that let it verify its own work.

EXPERIENCE

Plainly — Full-Stack Engineer, frontend-focused Nov 2023 – Present · Remote

Video automation company. Its platform, Plainly Videos, renders roughly 300,000 videos a month for API and no-code customers. Seven people, three engineers.

- **Built PlainlyFlows 0→1** — a new product dashboard from empty repo to launch in July 2026. Since launch I've shipped directly against user feedback, deciding the next slice from what people actually do in the product rather than from a spec.
- **Own the Plainly Videos app dashboard** — a React + TypeScript SPA covering projects, template parameterization, render queues and billing, used daily by customers automating video at scale.
- **Built the After Effects plugin solo and maintain it in the open** — a TypeScript CEP extension that lets designers push projects straight to Plainly. External issues and contributors, issue and PR templates, signed release builds shipped on tag.
- **Work on the Plainly MCP server**, which lets AI agents drive the render API directly — set up its CI and tag-based release pipeline, and reworked how it describes render parameters to agents so they call it correctly first time.
- **Own the quality gates**: Vitest and Playwright/Cypress suites gated in GitHub Actions, lint and format enforced by Biome and oxlint, frozen lockfiles, and continuous security dependency triage across four repos.
- Converted the plugin to a Turborepo monorepo and extracted a shared plainly-types package, so types are enforced at the boundary between the plugin, the examples, and our API.
- After a regression in how render parameters are built from user input reached production, I wrote the test suite around that logic — so changes near it fail loudly instead of breaking it silently again.
- Frontend performance: manual chunk splitting and route-level lazy loading against Vite bundle analysis, plus refactors cutting unnecessary useEffect and re-render churn.

Positive Tech — Full Stack Developer Nov 2022 – Nov 2023 · Novi Sad

- Delivered client projects across the JavaScript and TypeScript stack at a software outsourcing company, primarily React frontends shipped to external clients on their deadlines.

OPEN SOURCE & SIDE PROJECTS

nextra
Upstream PRs to the Next.js documentation framework — exposing Pagefind index options, and fixing uninformative error output on malformed meta fields.

filestack-react
Upstream fix so the package resolves correctly under Vite.

CEP-reload
Dev tool that hot-reloads host-side JSX in CEP panels, so you don't reopen the panel on every save.

willitspam.com
Email spam-score checker built on TanStack Start — SSR, shipped solo, 2026.

EDUCATION

Singidunum University — BSc, Computer Software Engineering 2026

SKILLS

CORE
TypeScript, JavaScript, React, HTML & CSS

FRONTEND
Next.js (App Router, SSR), TanStack Start / Query, Tailwind, shadcn/ui

QUALITY
Vitest, Playwright, Cypress, Jest, GitHub Actions, Biome, oxlint, ESLint, Prettier, Turborepo, pnpm

BACKEND
Node.js, Java, REST API design, MongoDB, PostgreSQL, Prisma, MCP servers

AI WORKFLOW
Claude Code as daily driver — project rules, agent code review in both directions, building MCP tooling agents consume
